

ABSTRACT OF THE DISCLOSURE

A high-speed RF link connects multiple users with individual data appliances to a projection system in a multi-user meeting. The RF link enables high-speed transmission of graphics data in either compressed or uncompressed form to the projection system where application-aware software/hardware carries out any necessary de-compression before display of the graphics data. The RF link also enables high-speed links between multiple users and between one or more users and an external network via a wireline connection to the projection system. A user's capability may also be enhanced by the addition of a local keyboard and a local display.
